Art Unit: 2819

1. Claims 1-27 are allowed.
2. The following is an examiner's statement of reasons for allowance: an analog-to-digital converter (ADC) wherein temperature-to- digital conversion is accomplished by first measuring a change in voltage V_{be} across the junction of a diode when different current densities are forced through the junction and the obtained change is proportional to temperature wherein as part of the conversion processing, V_{be} is multiplied by a fixed gain, and an offset voltage value is subtracted from V_{be} wherein the multiplication and subtraction functions are performed by a switched- capacitor integrator in a delta-sigma ADC, has not been shown in the prior art..

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

3. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Brown et al. disclose an A/D converter system and method with temperature compensation. The circuit includes a low noise analog-to-digital conversion chip and a precision voltage reference source. The voltage reference source includes a diode with two terminals and a passive attenuation circuit. The attenuation circuit and the diode are coupled in parallel between the two terminals to provide a voltage reference signal for use by the analog to digital conversion chip. The analog to digital chip uses the voltage reference signal to set the full-scale input range for the signal.
